

DEVELOPMENT STANDARDS & APP REGISTRATION

Tech Team Coordination

A standing group overseeing how technology — AI included — is adopted, governed, and supported at Redmond.

PURPOSE

Not a new department — a steering committee spanning IT, data, development, and projects

Why now

The questions arrive faster than any one team can answer them, and they cross boundaries: who owns a data source, what counts as sensitive, how much review a Lane 2 app needs.

What changes

Those questions have been answered ad hoc since August. No single team covers the problem. This makes the answering deliberate.

MEMBERSHIP

Eight people, five teams

Role	Who	Brings
Sponsor	Aaron	Business perspective; escalation path
Facilitator	Kirt	Cadence, documentation, keeping it moving
IT	Stuart	Access, roles, identity, servers, DNS
Development & App Team	Jeremiah	Code, the registry, development practice
Data	Bryan	Data sources, MCP, what is actually reachable
AI depth	Phil	MCP architecture, agent design, current practice
Projects	Travis	Cross-project view; monthly rather than weekly
Admin	Ken	Licensing, spend, and cost questions; optional attendee

Cadence. Weekly working session, Thursdays at 1:00. Broader stakeholder session roughly monthly. Add people when a gap shows, not preemptively.

SCOPE

Strategy here, operations there

Area	Sets the direction	Runs it day to day
Data access and classification	This team	Data Team
Security, roles, identity	This team	IT Team
The registry and renewals	This team	Development Team
Third-party applications	This team	App Team
Code review and dev standards	This team	Development Team

Nothing new gets created to run any of this. If the team started operating things, every access request would route through a weekly meeting — the exact friction the project exists to remove.

SECURITY

Security follows the need

There is no separate security owner. Whoever owns the thing owns securing it.

Security of	Owned by
Databases and data sources	Data Team
Login, identity, roles, access	IT Team
Servers, network, DNS	IT Team
Application code and its access	Development Team
Third-party applications	App Team
The app you built, in Lanes 1 and 2	The builder

This is why layered gates work. Permissions at the data layer, identity at the IT layer, scope at the MCP layer, review at the code layer — four teams securing their own lane, and the layering is the result.

AUTHORITY

Any team can decline within its own lane

Each team, its own lane

Data can decline a data request. IT can decline an access or role request. The app team can decline a change to a third-party system. Each answer stands on its own.

Development holds the last call

Most visibly at Lane 2 to Lane 3. They build, own, and support Lane 3 under an SLA, so they decide whether something is ready to promote — and whether it comes across as-is or needs work first.

Evaluation, not rewrite. Pull the code, find the gaps against Lane 3 requirements, produce a plan. The team that will carry something forever is the team that decides whether to accept it. This team sets the criteria; it does not make the individual call.

WHAT ESCALATES

Business risk decisions are not this team's to make

What Redmond would do about a ransom demand, what is worth spending to protect, whether an exposure is acceptable — those go up to business leadership.

The team's job is to surface the decision clearly, not to make it.

SEQUENCING

Day one versus later

Day one

- AI inventory — the registry, live now
- Use-case review and human oversight — the lane model
- Data governance and security — Phase 1B discovery
- Tool approval

Once that is running

- Enablement and training
- Change management
- Quality and reliability
- Monitoring and auditing
- Incident management

Not yet

- Performance and value measurement

There is nothing to measure until things are running.

RESOURCING

When to add a person

The trigger is the group no longer being able to absorb the work alongside existing duties.

Profile discussed

Enterprise development experience. Personable and outgoing. Open-minded rather than anchored to how development has always been done.

Longer term

This could become an AI operations team covering training, licensing, resources, and the internal AI channels. Not there yet, and naming it now would overstate what exists.

WHERE WE WOULD LIKE YOUR HELP

Your read on the group, and on it deciding rather than operating
